Job Title

Environmental Consultant

National Occupational Classification (NOC)

2223

Job Description

Your love of the environment and the need to help and protect it has got you working for an oil company as an environmental consultant. It is your responsibility to make sure that the company is doing as minimal damage as possible to the environment while getting the most out of it.

Your day starts out by putting on your sunscreen. A lot of it. You work outside all day long during pretty much any weather conditions. You hop in your old truck and head out to the site with all your different equipment. You make sure that the oil company isn't contaminating any of the air or water supply and help them to avoid creating any devastation to the environment.

First you set up at the new site that the company wants to start drilling at. You conduct a field survey. You start by collecting initial data to find out the baseline conditions of the site. You check the air quality followed by the water quality. The last thing you go over is the soil quality. You check everything over to make sure there are no pollutants. Next up is to your computer. You don't like to be cooped up in an office but computer and paper work is part of the job.

You then write your technical report. The owner of the company is always happy to read your reports. He never is confused and hardly needs you to translate. He asks you to go speak to a couple of his clients which you think is no problem! You are able to handle talking to people and put complicated terms into simpler terms for the untrained individual.
