Role Description

You graduated from high school with **honours in math**. You had already discovered an interest in modern technology through a love of stereo equipment and had hands-on experience as a Sound Technician for a local rock group. With help from your parents, some student loans, and a part-time job in an electronics repair shop, you were able to attend university for four years.

After the first year, your interest switched from audio technologies to exciting new developments in information and communications. You started studying Computer Science. Meanwhile, you were learning **troubleshooting skills** from your boss at the electronics shop, who took a liking to you. You were realizing that you liked working with people, and were good at **solving problems** and **making things work** and keeping excellent **documentation** on your work. You stayed with the problem until it was solved. You always knew the things can be made to work. This helped you choose your path through university, deciding which courses to take.

You had two excellent six month work terms as part of your degree requirements. You worked as a Programmer, doing **installations** and **debugging** for the university's computer services department. You found the job interesting, but kind of lonely. Then you were a Technician on a **team** that totally **overhauled and upgraded computer systems** for the phone company when they switched to digital equipment. This you totally enjoyed.

When you graduated with a Bachelor of Science degree in Computer Sciences the phone company hired you again, as a Programmer/Analyst to **set up new database systems** and **train the employees** in how to use new software. That was a one year contract, however, that will soon be ending. You are looking for a company that needs your combination of experience with technology and people while giving you a chance to learn something new.

You are 25 years old.
